

# AGENDA

# A G E N D A

01

**What is DevOps?**

02

**Why DevOps**

03

**DevOps Lifecycle**

- Continuous Development
- Continuous Testing
- Continuous Integration
- Continuous Deployment
- Continuous Monitoring

An abstract digital background featuring a dark blue grid. On the left, a wireframe sphere is partially visible. On the right, a stylized, low-poly hand is shown in a similar wireframe style. A thin, glowing red line extends from the hand towards the center of the image.

**WHAT IS DEVOPS?**

## What is DevOps?

---

- ∞ **DevOps** is a set of cultural concepts, practices, and tools that improves an organization's ability to create applications and services with a higher velocity
- ∞ DevOps is a collection of methods that bring together **software development (Dev)** and **IT operations (Ops)**

# What is DevOps?

**DevOps** goal is to minimize the systems development life cycle and continually provide high-quality software delivery

DevOps improves software development and delivery efficiency, speed, and security

Teams work together to develop, produce, and deploy reliable software faster

The DevOps delivery method creates & deploy faster and iterative applications

DevOps promotes a collaborative atmosphere throughout the development cycle

The background is a dark, textured surface with a faint grid pattern. Overlaid on this are several teal-colored wireframe shapes. On the left, there are two circular, ring-like structures made of interconnected triangles. A red laser line originates from a small red dot on the left ring and extends horizontally across the center of the image, passing behind the text. To the right of the text, there is a more complex, elongated wireframe shape that resembles a stylized hand or a mechanical component.

**WHY DEVOPS?**

# DevOps

DevOps provides continuous software delivery with fewer, easier-to-fix problems, and also faster problem resolution

The Devs and Ops Team work together in DevOps Methodology, resulting in a healthy working atmosphere

DevOps practices improved the efficiency of team members, improved communication between them

# Phases of DevOps

## DevOps Life Cycle

The background is a dark, textured surface with a faint grid pattern. A large, glowing teal wireframe infinity symbol is positioned on the left side. A hand, also rendered in a teal wireframe style, is shown on the right side, holding a small, glowing red sphere. The text "DEVOPS LIFECYCLE" is centered in the middle of the image.

# **DEVOPS LIFECYCLE**

# Continuous Development

The **Continuous Development** phase is where program is 'planned' and 'coded'. It includes all aspects of planning and coding

**01** This phase includes authoring the team members with their tasks, deciding deadlines, tools to be used

**02** In this phase, they use highly productive tools, automate repeated and manual tasks, and iterate in smaller production cycle

# Tools used for Continuous Development

---

Git

# Tools used for Continuous Development

---

## Git

- ❖ Git is a distributed version control tool that helps in the development of high quality software
- ❖ Git allows each developer to keep a copy of the source code and make changes to that copy itself
- ❖ Git is used to facilitate communication between the development and operations teams

# Continuous Integration

Continuous Integration is a software development approach that requires developers to submit the source code changes more often and integrate the entire process

**01** Code building includes code review, unit & integration testing, and packaging

**02** Teams quickly spot problems & resolve them because of frequent changes made

**03** Jenkins is one of the main tools used in this phase

# Tools used for Continuous Integration

## Jenkins

- ❖ It is an integration DevOps tool with many plugins expansion
- ❖ It downloads the new code from the Git repository and prepares a build of that code
- ❖ Jenkins is an essential DevOps tool since it enables Continuous Integration and Continuous Delivery

# Continuous Testing

The testing step examines the created code for errors and faults. It helps ensure that the generated software is usable

**01** This phase ensures that the generated software is usable & has no defects in terms of functioning

**02** In this phase, docker containers are used to simulate the full test environment

**03** Some of the tools used to do continuous testing are JUnit, Selenium, and TestNG

# Tools used for Continuous Testing

---

## Selenium

- ❖ Selenium is a popular open-source online application testing framework
- ❖ Test automation, uses software programs to automate the execution of test cases, compare results, and identify flaws
- ❖ Selenium does the automation testing, and TestNG generates the reports

# Tools used for Continuous Testing

---

## TestNG

- ❖ Test Next Generation(TestNG) is an open-source test automation framework
- ❖ TestNG shows a summary of the failed test case and the group it was part of and the class it belonged to
- ❖ TestNG helps to manage test cases as well as generate detailed test results

The TestNG logo is displayed inside a white circle, which is set against a dark blue rectangular background. The logo itself consists of the word "Test" in black, followed by "NG" in red and yellow.

TestNG

# Continuous Deployment

Continuous Deployment(CD) stage ensures the products are deployed smoothly, without impacting the application's performance

**01**

This technique eliminates the need for planned releases and speeds up the feedback system

**02**

It allows developers to respond to concerns faster and more accurately

**03**

It includes establishing & maintaining the app's functional requirements consistently

# Tools used for Continuous Deployment

---

## Puppet

- ❖ **Puppet** is an open-source system configuration, deployment, and server management DevOps tool that leverages declarative programming
- ❖ It is subdivided into reusable modules that enable quick setup of pre-configured servers and is cross-platform compatible

# Tools used for Continuous Deployment

---

## Ansible

- ❖ **Ansible** is a free and open-source DevOps solution for configuration management, automation, and orchestration
- ❖ Its Playbooks, which is basically a blueprint of the automation tasks, are written in YAML with minimum commands

# Continuous Operation

Continuity is a significant aspect in DevOps in reducing phases that frequently distract development, take longer to uncover errors, and result in a better version of the product

**01** This phase includes monitoring each of the phase of DevOps lifecycle & IT Operations

**02** This phase ensures the health, performance and reliability of your application is up to date

# Continuous Monitoring

Monitoring a software product's performance is critical for determining the overall effectiveness of the product's output

**01** Developers can find general patterns and parts in the program that require more attention through constant monitoring

**02** Continuous monitoring is an operational phase whose goal is to improve the software application's overall efficiency

## Tools used for Continuous Monitoring

### Splunk

- ❖ **Splunk** is a software platform that allows searching, analyzing, and displaying machine-generated information
- ❖ It creates graphs, alerts, dashboards, and visualizations by collecting, indexing, and correlating real-time data

# Tools used for Continuous Monitoring

---

## Nagios

- ❖ The **Nagios** tool helps in continuously monitoring systems, applications, services, and business processes
- ❖ Nagios is a server-based monitoring system that operates as a daemon or service
- ❖ It executes plugins on the same server regularly, contacting hosts or servers on your network or the internet

# **BENEFITS OF DEVOPS**

# Benefits of DevOps

---

**Improved  
Collaboration and  
Communication**

**Reduced Time-To-  
Recovery**

**Reliability and  
Scalability with Less  
Risk**

**Cost Savings**

# Benefits of DevOps

**DevOps includes a significant cultural transformation that eliminates communication barriers**

**Reduced Time-To-Recovery**

**Reliability and Scalability with Less Risk**

**Cost Savings**

# Benefits of DevOps

---

**Improved  
Collaboration and  
Communication**

**DevOps approaches  
helps in reducing  
the overall efficiency  
effect of the overall  
failures**

**Reliability and  
Scalability with Less  
Risk**

**Cost Savings**

# Benefits of DevOps

**Improved  
Collaboration and  
Communication**

**Reduced Time-To-  
Recovery**

**DevOps allows  
teams to deploy new  
software while  
securing current  
on-premises data**

**Cost Savings**

# Benefits of DevOps

**Improved  
Collaboration and  
Communication**

**Reduced Time-To-  
Recovery**

**Reliability and  
Scalability with Less  
Risk**

**DevOps adds value  
to the company and  
save money on  
maintenance and  
upgrades**
